

Standards MT November 2026

Category 3 - Treasury Markets - FX,
Money Markets and Derivatives

Message Usage Guidelines

These usage guidelines provide information about support for derivatives in Standards Category 3 messages. In particular, the document contains specific information about the MT 300, MT 304, MT 305, MT 306, and MT 396, as well as guidance that is equally relevant to other MTs. This document is for users of Standards Category 3 messages that trade derivatives.

Preface

Purpose of this document

These usage guidelines provide information about support for derivatives in Standards Category 3 messages. In particular, the document contains specific information about the MT 300, MT 305, MT 306, and MT 396, as well as guidance that is equally relevant to other MTs.

This usage guide describes how Category 3 messages should be used to support various classes of FX derivative instruments. Rate derivatives (MT 34x and MT 36x) as well as commodity derivatives (MT 60x) are not discussed. This document provides usage guidelines and example messages.

This document does not attempt to provide a comprehensive definition of the messages, nor does it describe all possible uses. It rather covers various realistic scenarios, from which other uses can be inferred.

Audience

This document is for users of Standards Category 3 messages that trade derivatives.

CAUTION This volume contains information effective as of the November 2026 Standards release. Therefore the 18 July 2025 edition of the Standards MT User Handbook volumes remains effective until November 2026.

Significant Changes

The following table lists significant changes to the content of the *Category 3 - Treasury Markets - FX, Money Markets and Derivatives Message Usage Guidelines* since the 18 July 2025 edition. This table does not include editorial changes that Swift makes to improve the usability and comprehension of the document.

Updated information	Location
Updates to examples	Throughout the document

1 Derivatives Overview

The following table summarises the different derivative instruments that are supported by each relevant message type.

Message type	Derivative instrument
MT 300 Foreign Exchange Confirmation MT 304 Advice/Instruction of a Third Party Deal	Spot (not classed as a derivative) Forward Swap Non-deliverable forward and other cash-settled trades
MT 305 Foreign Currency Option Confirmation	Deliverable vanilla option Non-deliverable and other cash-settled vanilla option
MT 306 Foreign Currency Option Confirmation	Vanilla options with additional clauses such as early termination Barrier options Binary options Averaging options and forwards

NEXT VERSION

2 Forwards and Swaps

Deliverable forwards are generally treated similarly to spot trades, except that in the MT 304 there is additional support for closing out a forward position.

An FX swap is processed as two separate legs, that is, a near leg and a far leg, each with its own MT 300 or MT 304. Within the MT 300 and MT 304, field 22W Link Swap Identification can be used to hold a single reference for the two legs of the swap, thereby allowing them to be linked explicitly.

Field 22U Unique Product Identifier can optionally be used to specifically identify that the trade is a forward or swap.

NEXT VERSION

3 Non-Deliverable Forwards

Prior to SR 2017, non-deliverable forward (NDF) trades were supported by means of including codes in free-format fields (77D and 72) in the MT 300 and MT 304. From SR 2017 and onwards, specific fields for NDFs must be used. Messages that include the previous NDF codes in free-format fields are NAKed by the network.

Note *The guidelines for NDFs in this section apply equally to other types of cash-settled forward trades. This includes cash-settled forwards and options that are subject to ISDA's Additional Provisions for Cash-Settled Forwards and Options (CSF, CSO) in Deliverable Currencies. From SR 2022 onwards, additional support is added for non-deliverable trades between fiat (ISO 4217) currencies and digital tokens.*

3.1 NDF Life Cycle Support

To confirm a non-deliverable forward trade, both parties should exchange MT 300 confirmations at the opening and at the valuation (also known as fixing or closing) of the trade.

To notify a non-deliverable forward trade to a party such as a custodian or settlement system, MT 304 notifications must be sent to this party at the opening and at the fixing of the trade.

3.2 MT 300 NDF Specific Features

The following fields must be used specifically for NDF confirmations.

Field	Description	Validation
:17F: Non-Deliverable Indicator	Flag to indicate whether the confirmation is for an NDF opening or a valuation.	The field is optional, but the subsequent NDF fields can only be used if 17F is set to Y.
:17O: NDF Open Indicator	Flag to distinguish between an opening and a valuation.	This field is mandatory if 17F is set to Y.

Field	Description	Validation
:32E: Settlement Currency	The currency in which the NDF will settle. This is normally one of the traded currencies that are included in sequence B, but does not have to be.	Mandatory if the confirmation is for an opening. Otherwise, it is not allowed.
:30U: Valuation Date	The date on which the NDF will be valued. This is typically two business days prior to trade settlement.	Mandatory if the confirmation is for an opening. Otherwise, it is not allowed.
:14S: Settlement Rate Source	The rate source or sources that are used to value the NDF. For a currency pair whose terms are governed by an EMTA template, this field should be set to EMT00. For a currency cross (for example, GBP-BRL where GBP is the settlement currency and BRL is the reference currency), typically two rate sources must be provided, which is implemented by including two instances of the field. In this case, the two rate sources should be included in order of reference currency before settlement currency, for example, EMT00 before GBP03.	Mandatory if the confirmation is for an opening. Otherwise, it is not allowed.
:21A: Reference to Opening Confirmation	This field is required in the valuation confirmation to provide the Sender's Reference (field 20) of the original NDF opening confirmation.	Mandatory if the confirmation is for a valuation. Otherwise, it is not allowed.

Several other fields of the MT 300 have specific meaning or usage in the context of an NDF.

Field	Comment
:30T: Trade Date	On the opening, this is the date on which the trade was executed. On the valuation, this is the date of the valuation.
:30V: Settlement Date	On both opening and valuation, this is the final settlement date.
:36: Exchange Rate	On opening, this is the exchange rate of the NDF. On valuation, this is the valuation rate that was taken from the agreed rate source.
:32B: Currency, Amount Bought :33B: Currency, Amount Sold	On both the opening and valuation, the amount fields should include the notional (gross) amounts for both the deliverable and non-deliverable currency. The amount of the non-deliverable currency should not change between the opening and the valuation. The direction of buy and sell currencies switches between the opening and the valuation. The final settlement amount is not explicitly stated in the MT 300, but is determined by calculating the difference in the deliverable currency amounts between the opening and valuation messages.
:57a: Receiving Agent in subsequences B1 and B2	:57J:/NOSI/NDFS should be used in both the opening and the valuation confirmations for the non-deliverable currency. Full settlement instructions should be included for the deliverable currency in both the opening and valuation, except in situations where settlement is in a third currency (that is, field 32E contains neither of the currencies in fields 32B and 33B). In this scenario :57J:/

Field	Comment
	NOSI/NDFS should be used for both currencies; the settlement instructions for the settlement currency must be agreed outside of the MT 300 confirmation.

The following fields are used for cash-settled forwards in deliverable currency pairs.

Field	Comment
:77H: Type, Date, Version of the Agreement	On the opening, this field must contain the code ISDACS for cash-settled forwards that are subject to ISDA additional provisions for cash-settled forwards in deliverable currency pairs.
:26K: Calculation Agent	On the opening, this field should be used to identify which party will act as calculation agent for the trade. Optional if the confirmation is for an opening. Otherwise, it is not allowed.

All other fields in the MT 300 should be populated in a similar way to a deliverable spot or forward trade confirmation.

3.3 MT 304 NDF Specific Features

The following fields must be used specifically for NDF instructions.

Field	Description	Validation
:94A: Scope of Operation	This field must contain the code ANDF to indicate that it is an NDF.	Subsequent NDF-related fields can only be used if 94A contains ANDF.
:17O: NDF Open Indicator	Flag to distinguish between an opening and a valuation.	This field is mandatory if 94A contains ANDF.
:17F: Final Close Indicator	Flag to indicate if this is the final close of an NDF. This may be used, for example, when an investment manager finally closes out an NDF.	This field is mandatory for an NDF valuation (that is, field 17O contains N).
:32E: Settlement Currency	The currency in which the NDF will settle. This need not be one of the traded currencies that are present in sequence B.	Optional if the instruction is for an NDF. Otherwise, it is not allowed.
:30U: Valuation Date	The date on which the NDF will be valued. This is typically two business days prior to trade settlement.	Mandatory if the instruction is for an NDF. Otherwise, it is not allowed.
:14S: Settlement Rate Source	The rate source or sources that are used to value the NDF. For a currency pair whose terms are governed by an EMTA template, this field should be set to EMT00. For a currency cross (for example, GBP-BRL where GBP is the settlement currency and BRL is the reference currency), typically two rate sources are provided, which is implemented by including two instances of the field. In this case, the two rate sources should be included in order of reference currency followed by settlement currency, for example EMT00 before GBP03.	Optional if the instruction is for an NDF. Otherwise, it is not allowed.

Field	Description	Validation
:21A: Reference to Opening Confirmation	This field is used in the valuation confirmation to provide the Sender's Reference (field 20) of the original NDF opening instruction.	Optional if the instruction is for an NDF. Otherwise, it is not allowed.

Several other fields of the MT 304 have specific meaning or usage in the context of an NDF.

Field	Comment
:30T: Trade Date	On the opening, this is the date on which the trade was executed. On the valuation, this is the date of the valuation.
:30V: Settlement Date	On both opening and valuation, this is the final settlement date.
:36: Exchange Rate	On opening, this is the exchange rate of the NDF. On valuation, this is the valuation rate that was taken from the agreed rate source.
:32B: Currency, Amount Bought :33B: Currency, Amount Sold	On both opening and valuation, the amount fields should include the notional (gross) amounts for both the deliverable and non-deliverable currency. The amount of the non-deliverable currency should not change between the opening and the valuation. The direction of buy and sell currencies switches between the opening and the valuation. The final settlement amount is included in fields 17G and 32G of sequence E in the MT 304 valuation message.
:53a: Delivery Agent in subsequence B1 and :57a: Receiving Agent in subsequence B2	:53J:/NOSI/NDFS and :57J:/NOSI/NDFS should be used for in both the opening and valuation instructions for the non-deliverable currency. Full settlement instructions should be included for the deliverable currency in both the opening and valuation, except in situations where settlement is a third currency (that is, field 32E contains neither of the currencies in fields 32B and 33B). In this scenario, settlement instructions must be agreed outside of the MT 304 instruction.

The following fields are used for cash-settled forwards in deliverable currency pairs.

Field	Comment
:77H: Type, Date, Version of the Agreement	On the opening, this field must contain the code ISDACS for cash-settled forwards that are subject to ISDA additional provisions for cash-settled forwards in deliverable currency pairs.
:26K: Calculation Agent	On the opening, this field should be used to identify which party will act as calculation agent for the trade. Optional if the confirmation is for an opening. Otherwise, it is not allowed.

All other fields in the MT 304 should be populated in a similar way to a deliverable spot or forward trade confirmation.

3.4 Examples

3.4.1 Example Non-Deliverable Forward – EMTA

On 21 November 2017 Growth Investments in London (GRINGB2L) agrees on a non-deliverable forward trade with JP Morgan in New York (CHASUS33), for a fund with identifier GI00123. Growth Investments buys 285,928.04 USD and sells 1,000,000 BRL for settlement date 18 January 2018 at a rate of 0.285928. Growth Investments' custodian is State Street in London, while JP Morgan uses its branch in New York for USD settlement. The valuation date for the non-deliverable trade is 16 January 2018. The terms of the NDF are governed by an EMTA template.

On 16 January 2018, the parties determine the settlement amount of the non-deliverable forward trade, by using the valuation rate of 0.29235 that was taken from the agreed rate source. Settlement will take place on 18 January 2018.

3.4.2 Example Non-Deliverable Forward – Currency Cross

This example is similar to the previous, except that it is for a currency cross and therefore includes two instances of field 14S Settlement Rate Source. Due to the similarity with the previous example, only the first MT 300 is shown, with the specific differences highlighted.

On 21 November 2017 Growth Investments in London (GRINGB2L) agrees on a non-deliverable forward trade with JP Morgan in New York (CHASUS33), for a fund with identifier GI00123. Growth Investments buys **285,928.04 GBP** and sells 1,000,000 BRL for settlement date 18 January 2018 at a rate of 0.285928. Growth Investments' custodian is State Street in London. The valuation date for the non-deliverable trade is 16 January 2018.

3.4.4 Example Cash-Settled Trade in a Digital Currency

On 01 December 2021 Growth Investments in London (GRINGB2L) agrees on a cash-settled forward trade with JP Morgan in New York (CHASUS33), for a fund with identifier GI00123. Growth Investments buys **116,908.04 GBP** and sells 8 bitcoins for settlement date 01 February 2022 at a rate of 14613.505. Growth Investments' custodian is State Street in London. The valuation date for the cash-settled forward trade is 28 January 2022. The parties will jointly act as calculation agent.

4 FX Options

FX options are split into *vanilla* and *exotic*. An FX *vanilla option* is a financial instrument that gives the holder the right, but not the obligation, to buy or sell an underlying currency at a predetermined price within a given time frame. A *vanilla option* is a normal *option* that has no special or unusual features. An exotic option is one which has features making it more complex than the more commonly traded vanilla options.

The MT 305 is used for deliverable and non-deliverable vanilla options.

The MT 306 is used for options that have exotic features. The following exotic options are supported:

- A barrier option is an exotic option whose existence depends upon the underlying currencies' exchange rate reaching pre-set barrier level; the option either springs into existence (known as *knock-in*) or, if the option already exists, it is extinguished (known as *knock-out*).
 - The option may have two barriers, which may both be knock-in or knock-out.
 - It is possible to specify that the barriers are monitored during one period or more than one period.
 - It is also possible to specify that the barrier is monitored only at discrete times and not continuously.
 - The option may be deliverable or non-deliverable.
- Binary options are a class of options in which a fixed pay-out is made if a specified condition is met during the life of the option.
 - Binary options always have a barrier.
 - It is possible to specify that the barrier is monitored only at discrete times and not continuously.
- It is possible to specify an optional early termination clause for options that do not have a barrier or averaging features, which gives the buyer the right to terminate the option early at specified times during its lifespan.
- Averaging forwards and options, in which either the forward rate, strike price, or settlement rate are calculated based on an average rate calculated over an agreed period. It is also possible to calculate more than one of the forward rate, strike price, or settlement rate, however only certain combinations are allowed.

It is beyond the scope of this document to describe all these instruments in detail, but much useful information is readily available on the Internet.

4.1 Exotic Option Life Cycle Support

As well as supporting the initial confirmation of exotic option trades, the MT 306 may be used to confirm the following life cycle events:

- Confirmation of a close-out.
- Notice of a knock-in which has triggered the option into existence. Prior to that level being touched, no option exists.
- Notice of a knock-out which has triggered termination of the option.
- Notice of a barrier event for a binary option.
- Confirmation of the amounts and rates in sequence D that have been determined following the conclusion of the averaging period.

4.2 FX Options Close-Outs

4.2.1 Option Close-Outs

The parties to an option trade may agree to close out (also known as early termination) of the option. In this case, the option may have some agreed residual value to the original buyer, which the seller agrees to return. This is known as the "surrender" value. The close-out may be for the full underlying amounts of the original option or may be partial, in which case some of the original option will remain. Both vanilla and exotic options may be closed out.

The MT 305 and MT 306 are used to confirm the close-out of vanilla and exotic options, respectively. The close-out confirmation of a full close-out, is effectively the opposite of the confirmation of the original trade, albeit with a different premium price.

The key economic terms of a full and partial close-out trade are shown in the example below. In this case, the surrender values of the option are USD 450 and USD 250, respectively.

	Original option trade		Full close-out		Partial close-out
Buyer	Party A		Party B		Party B
Seller	Party B		Party A		Party A
Premium	USD 1,000		USD 450		USD 250
Strike	0.936		0.936		0.936
Buy currency, amount	EUR 9,360		EUR 9,360		EUR 4,680
Sell currency, amount	USD 10,000		USD 10,000		USD 5,000
Expiry date	1 Jan 2019		1 Jan 2019		1 Jan 2019

The confirmation of a partial close-out contains only the put and call currencies and amounts that are being closed out, with the residual value of the open option being the difference between the original option put and call amounts and the closed-out amounts.

4.2.2 Vanilla Option - MT 305 Specific Features

The following table describes how specific fields must be used for confirming close-outs of a vanilla option. All other fields in the MT 305 close-out must contain the same data as the original option confirmation.

Field	Description
:20: Transaction Reference Number	The close-out confirmation must have a new reference.
:21: Related Reference	For a new close-out confirmation, this field must contain the transaction reference number (field :20:) of the confirmation of the original option that is being closed out. In a case where the original option confirmation was amended, this should be the reference of the last confirmation in the chain. For a close-out that is being amended or cancelled, this field must contain the reference of the confirmation that is being amended or cancelled, respectively.
:22: Code/Common Reference	The code CLOSEOUT must be used for a new close-out confirmation. If a close-out confirmation is amended or

Field	Description
	cancelled, then AMEND or CANCEL must be used, as appropriate. Note <i>For matching purposes, a close-out confirmation must always be matched with another close-out confirmation.</i> The common reference must reflect the data contained in the close-out confirmation, which should be the same as the data in the original option confirmation.
:23: Further Identification	Code 1 (BUY or SELL) must be the opposite of the Code 1 of the option that is being closed out. That is a BUY is closed out with a SELL and a SELL is closed out with a BUY. Code 2, Code 3, and Currency must be the same as they were in the confirmation of the option that is being closed out.
:30: Date Contract Agreed	This must be the date that the close-out was agreed.
:32B: Underlying Currency and Amount	For a full close-out, this must contain the same currency and amount as the original option confirmation. For a partial close-out, this must contain the same currency as the original option confirmation. The amount should contain the amount that is being closed out. The difference between the amount in the original confirmation and the amount in the close-out confirmation represents the remaining "open" amount of the option.
:33B: Counter Currency and Amount	For a full close-out, this must contain the same currency and amount as the original option confirmation. For a partial close-out, this must contain the same currency as the original option confirmation. The amount should contain the amount that is being closed out. The difference between the amount in the original confirmation and the amount in the close-out confirmation represents the remaining "open" amount of the option.
:37K: Premium Price	This field must contain the currency and amount or the rate which is used to calculate the surrender value of the option.
:34a: Premium Payment	This field must contain the date, currency, and amount of the surrender payment. If the original option was bought by Party A of the close-out message, then Party A receives a payment for the close-out, hence field option 34R must be used. If the original option was sold by Party A of the close-out message, then Party A makes a payment for the close-out and field option 34P must be used.
:57a: Account With Institution	This field must identify the financial institution and account where the payee will receive the surrender payment.

4.2.3 Exotic Option - MT 306 Specific Features

The following table describes how specific fields must be used for confirming close-outs of an exotic option. This includes full and partial close-out of an MT 306 that includes sequence D

Vanilla Block. The table does not provide guidance for binary options. All other fields in the MT 306 close-out must contain the same data as the original option confirmation.

Note *An option that was confirmed with an MT 306 must always be closed out with an MT 306, even when, for example, a knock-in barrier has been hit, such that the option is now effectively a vanilla option.*

Field	Description
Sequence A	
:20: Sender's Reference Number	The close-out confirmation must have a new reference.
:21: Related Reference	For a new close-out confirmation, this field must contain the related reference (field :20:) of the confirmation of the original option that is being closed out. In a case where the original option confirmation was amended, this should be the reference of the last confirmation in the chain. For a close-out that is being amended or cancelled, this field must contain the reference of the confirmation that is being amended or cancelled, respectively.
:22A: Type of Operation	The code NEWT must be used for a new close-out confirmation. If a close-out confirmation is amended or cancelled, then AMND or CANC must be used, as appropriate.
:22K: Type of Event	CLST must be used for a close-out. Note <i>In regards to identification of a close-out, the MT 305 is structurally different to the MT 306.</i> <i>For matching purposes, a close-out confirmation must always be matched with another close-out confirmation.</i>
Sequence B	
:17V: Buy (Sell) Indicator	Must contain the opposite of the indicator that was present in the option that is being closed out. That is a B is closed out with an S and an S is closed out with a B.
:30T: Trade Date	The date that the close-out was agreed.
:37K: Premium Price	This field must contain the currency and amount or the rate which is used to calculate the surrender value of the option.
:30V: Premium Payment Date	The date on which the surrender payment will be made.
:34B: Premium Currency and Amount	The currency and amount of the surrender payment.
Sequence C	
:57a: Account With Institution	This field must identify the financial institution and account where the payee will receive the surrender payment.
Sequence D	
:32B: Put Currency and Amount or Party A Sold Currency and Amount	For a full close-out, this must contain the same currency and amount as the original option confirmation. For a partial close-out, this must contain the same currency as the original option confirmation. The amount should contain the amount that is being closed out. The difference between the amount in the original confirmation and the amount in the close-out confirmation represents the remaining "open" amount of the option.

Field	Description
:33B: Call Currency and Amount or Party A Bought Currency and Amount	For a full close-out, this must contain the same currency and amount as the original option confirmation. For a partial close-out, this must contain the same currency as the original option confirmation. The amount should contain the amount that is being closed out. The difference between the amount in the original confirmation and the amount in the close-out confirmation represents the remaining "open" amount of the option.

4.2.4 Example Messages

4.2.4.1 Full Close-Out of Vanilla Option

Deutsche buys a EUR/USD put option from Citi on 3 April 2018 for expiry on 17 June 2018. The agreed premium rate is 2.25%. On 1 May, Deutsche closes out the option. Citi agrees to pay a close-out surrender rate of 1.15% to Deutsche.

4.3 Non-Deliverable Options

Vanilla non-deliverable and cash-settled options should be confirmed using the MT 305, but if they have a barrier or other construct that does not fit in the MT 305 they should be confirmed using the MT 306.

4.3.1 Vanilla NDO Features

A non-deliverable option must be identified by putting "Y" in field 17F Non-Deliverable Indicator. This should be used when the option is cash settled, irrespective of whether the underlying currencies are deliverable or non-deliverable.

If field 17F contains "Y", then fields 32E Settlement Currency and at least one instance of 14S Settlement Rate Source must be included.

In field 26F Settlement Type in sequence A General Information, the settlement type should be specified as NETCASH.

For options that are covered by the ISDA Additional Provisions for Cash-Settled Forwards and Options, field 77H must contain code ISDACS. Field 26K Calculation Agent may also be included in the message.

4.3.1.1 Example Non-Deliverable Vanilla Option and Exercise

The following example is for a non-deliverable vanilla option. The terms of the option are governed by an EMTA template. The example includes both the MT 305 confirmation of the NDO and the MT 300 confirmation of the exercise. The example is for a USD/CNY option subject to an EMTA template and with European style expiry and settlement in USD.

MT 305 confirmation of NDO

4.3.2 Non-Deliverable Barrier and Other Non-Vanilla NDOs

The format of field 14S Settlement Rate Source in sequence H Non Deliverable Option Block includes an optional time and location for the rate source. It is repetitive in order to cater for cross-currency NDOs.

Note *In practice, this field is not expected to be repeated more than once in this sequence or indeed wherever it occurs in the MT 306. (In other words, there will not be more than two instances of field 14S Settlement Rate Source in either this sequence or in any other sequence in the message.)*

For options that are covered by the ISDA Additional Provisions for Cash-Settled Forwards and Options, field 77H must contain code ISDACS. Field 26K Calculation Agent may also be included in the message.

4.3.2.1 Example Non-Deliverable Barrier Option

The following example is for a non-deliverable cross-currency option that has an up and in knock-in barrier.

Sequences	Explanation	Format

Sequence H - Non Deliverable Block	Non Deliverable Block	: 15H :
	Settlement Rate Source	: 14S : EMT00
	Settlement Currency	: 32E : USD

4.4 Physically Fixed Deliverable Options

These are deliverable options that are "auto-exercised" based on an agreed rate source.

The agreement whether to auto-exercise is covered by a master agreement and is not recorded in the MT 305 or MT 306 itself.

4.4.1 Vanilla Options

For an MT 305:

- 26F Settlement Type in sequence A General Information should be PRINCIPAL.
- 14S Settlement Rate Source should be present in sequence A General Information. This field may be repeated if a cross-currency rate is required.

4.4.2 Barriers and Other Non-Vanilla Options

For an MT 306:

- 17F Non-Deliverable Indicator in sequence A General Information should be N.
- 14S Settlement Rate Source should be present in sequence B Transaction Details. This field may be repeated if a cross-currency rate is required.

4.5 Multiple Monitoring Period Barrier Options

The MT 306 supports specification of a monitoring period for barrier options.

It also supports multiple monitoring periods, so these can be defined during which the barriers are monitored.

4.5.1 Multiple Monitoring Period Features

Multiple monitoring periods are specified by repeating subsequence F1 Barrier Window Block within sequence F Barrier Block, for each period.

Multiple monitoring periods must be specified in increasing chronological order.

4.5.2 Example Multiple Monitoring Period Barrier Option

The following example is for an up and in knock-in barrier option whose barrier is monitored over three periods, during June, July, and August 2024.

Sequences	Explanation	Format
Sequence A – General Information	General Information	: 15A :
	Sender's Reference	: 20 : 656464
	Type of Operation	: 22A : NEWT
	Common Reference	: 22C : CITI333214DRESFF

	Barrier Monitoring Period	: 30I : 20240705/20240719
	Barrier Monitoring Period	: 30I : 20240806/20240820

4.6 Continuous and Discrete Barrier Options

The MT 306 supports barrier options, in which the barrier or barriers are monitored within a period. It also supports multiple monitoring periods.

A continuous barrier is one for which the barrier event is considered at all times during the continuous time period or spot market's opening hours.

A discrete barrier is one for which the barrier event is considered at discrete times.

4.6.1 Continuous Barrier Features

Continuous barrier options must have field 14M Barrier Time Type in sequence F set to CONT.

A continuous time period for monitoring can be specified in field 29O Continuous Time Period in sequence F, this will be applied to all dates in the monitoring periods defined in field 30I Barrier Monitoring Period in sequence F1.

Alternatively, a spot market's opening hours to be used for monitoring can be specified in field 14N Spot Market in sequence F, this will be applied to all dates in the monitoring periods defined in field 30I Barrier Monitoring Period in sequence F1.

A continuous time period or spot market's opening hours cannot both be specified, populating either field is optional.

4.6.2 Discrete Barrier Features

Discrete barrier options must have field 14M Barrier Time Type in sequence F set to DISC.

A time or time source for monitoring must then be specified in either field 29J Barrier Event Determination Time in sequence F or field 14O Barrier Event Determination Time Source in sequence F. This will be applied to all dates in the monitoring periods defined in field 30I Barrier Monitoring Period in sequence F1.

A barrier event determination time or barrier event determination time source cannot both be specified.

4.6.3 Example Continuous Barrier Option

The following example is for an up and in knock-in barrier option whose barrier is monitored continuously during the global spot market's opening hours throughout the monitoring period.

Sequences	Explanation	Format
Sequence A – General Information	General Information	: 15A :

4.7 Binary Options

The MT 306 supports exotic (or "non-vanilla") options in which a fixed pay-out is made if specific barriers are met. These are known as binary options.

Barriers may be monitored continuously during the life of the option, however, a discrete binary option is one for which the barrier event is monitored at discrete times, rather than the normal continuous barrier case.

Binary options must have sequences E, F, and G present. Field 12E and 17A in sequence A should not be present.

4.7.1 Binary Barrier Features

The same barrier features as outlined in [Continuous Barrier Features](#) on page 36 and [Discrete Barrier Features](#) on page 36 apply to binary options.

4.7.2 Example Continuous Binary Option

The following example is for a down and in knock-in non-deliverable binary option which will be monitored against the EMTA template, the barrier is monitored continuously during the local spot market's opening hours throughout the monitoring period.

4.8 Averaging Options and Forwards

4.8.1 Options

A currency option transaction in which the strike price is determined through an averaging calculation is supported. The strike price of the option is derived from an average of currency exchange rates accumulated during the averaging periods. In other words, the strike rate remains unknown until all observations have been collected.

A currency option transaction in which the settlement rate is determined through an averaging calculation is supported. The value of the option at expiry and hence whether or not any payment is made and its size are based on exchange rates between the two currencies at various specified points during the life of the option. In other words, this option has a specific expiration date and an averaging period during its life which determine the option's value at maturity.

A currency option transaction in which both the strike price and the settlement rate are determined through an averaging calculation is supported.

4.8.2 Forwards

A forward transaction in which the forward rate is determined through an averaging calculation is supported.

A forward transaction in which the settlement rate is determined through an averaging calculation is supported.

A forward transaction in which both the forward rate and the settlement rate are determined through an averaging calculation is supported.

There is no premium for these products.

Where the settlement rate is being calculated through an averaging calculation for a forward it can only be non-deliverable.

4.8.3 Averaging Option and Forward Features

Codes for averaging options and forwards are present in field 12F Option or Forward Style in sequence A General Information. Conditional optional sequence J Averaging Options and Forwards is present in the MT 306 in order to support these products.

Sequence J includes subsequences for settlement rate and forward rate or strike price details, both of which must be used when more than one rate is being calculated through an averaging calculation.

Each averaging period has an associated weighting factor, which defines how the rate is being calculated.

Several other fields are present in the sequence. The precise usage of these fields must be in accordance with ISDA's 2022 Averaging Supplement.

Subsequence B1 Premium Details and sequence C Settlement Instructions for Payment of Premium must not be present if an averaging forward is being confirmed.

Sequence H Non Deliverable Block must also be present if the option is cash-settled.

Field 12E in sequence A and field 17V in sequence B should not be present if an averaging forward is being confirmed.

4.8.4 Example Averaging Products

4.8.4.1 Averaging Option with Settlement Rate Calculated

The following example is for a non-deliverable averaging option, where the settlement rate is calculated from the rate taken from four dates with equal weighting.

4.9 Optional Early Termination

An early termination clause can be built into an option, which gives either the buyer or the seller the right to terminate the option at a market price on specified dates during the option's life.

Early termination can be defined for any type of option that is supported by the MT 306 that does not have a barrier or averaging features.

4.9.1 Early Termination Features

Sequence I Early Termination is present in the MT 306 to allow optional early termination clauses to be included within the confirmation.

The early termination style can be:

- European – a single date on which the option can be terminated. In this case, a single early termination date is specified in field 30T Early Termination Date in sequence I Early Termination.
- American – a period during which the option can be terminated. In this case, a start date is specified in field 30Y Commencement Date and an end date in field 29L Expiry Details.
- Bermuda – a set of dates on which the option can be terminated. In this case, the first date is specified in field 30T Early Termination Date, with the repeating frequency specified in field 22Y Frequency of Early Termination.

Details of how the early termination is settled may also optionally be specified in sequence I.

Note *The early termination style is distinct from whether the underlying option is European, American, or Bermuda.*

4.9.2 Example Early Termination

The following example is for a vanilla European option with a Bermuda style optional early termination clause that allows the buyer to early terminate on a monthly basis starting on a specified date during the life of the option.

Sequences	Explanation	Format
Sequence A - General Information	New Sequence	: 15A :

5 Unique Transaction Identifier (UTI)

A key data element required for regulatory reporting purposes is the Unique Transaction Identifier (UTI), also known as the Unique Swap Identifier (USI).

As per GFMA (Global Financial Markets Association) Market Architecture Group recommendations (see [http://gfma.org/Initiatives/Foreign-Exchange-\(FX\)/FX-Market-Architecture-Group-\(MAG\)/](http://gfma.org/Initiatives/Foreign-Exchange-(FX)/FX-Market-Architecture-Group-(MAG)/)), the UTI should be included in confirmations of FX derivatives (forwards, swaps, non-deliverable forwards, and options). This section provides guidance on how the UTI fields should be populated within Swift message types. There is particular focus on the European EMIR regulations, under which both parties must report the trade using the same UTI and there is therefore a need to handle UTIs correctly in trade confirmations.

The UTI for a trade is likewise, in many cases, required by a custodian or other third party and is therefore also supported in the MT 304.

The underlying format of a UTI and the mechanism for generation is, in some-cases, jurisdiction dependant. Industry guidelines exist for this purpose, for example, see www.isda.org and this topic is beyond the scope of this document.

5.1 Using the UTI

As per regulatory requirements, each derivative transaction requires a UTI for regulatory reporting purposes.

When the UTI is available, the repetitive *Reporting Parties* subsequence in the Category 3 and Category 6 messages (the structure in the MT 304 is slightly different) may be used to communicate the UTI. There are codes for the reporting jurisdictions included in the standard (CFTC, ESMA, etc.).

The UTI itself is represented by 2 fields:

- 22M - is the namespace or issuer code which is up to 20 characters, and
- 22N - which is the transaction identifier which is up to 32 characters

In some scenarios, a trade may have more than one UTI, for example to meet specific requirements for different jurisdictions. In this situation, multiple UTIs may be included. A trade may also have one or more prior UTIs, for example due to block allocation or a novation. One or more prior UTIs may also be included in the Swift message in these cases.

5.2 UTI Fields

This section describes the fields that are available to be used for communicating the UTI.

Note that:

- A UTI consists of a combination of a namespace and transaction identifier. In some systems, these are concatenated into a single string, but in Swift MTs the two components are carried separately.
- The maximum overall length of a UTI is 52 characters, which is aligned with the EMIR regulations.
- Each UTI is associated with a single reporting jurisdiction field.

Note *In all MTs except the MT 304, it is possible to include multiple UTIs for a single jurisdiction, but this feature is not commonly used.*

- Each UTI may be associated with 0, 1, or more prior UTIs.

Field	Description	Validation
:22L: Reporting Jurisdiction	This field specifies the supervisory party to which the trade needs to be reported or under which the UTI was created.	Several jurisdiction codes are included in the description of the field. These codes are not validated by FIN. If the specific jurisdiction code for the UTI is not present in the existing list, then use the code OTHR and include the reporting jurisdiction in field 77A (Additional Reporting Information). ⁽¹⁾
:22M: UTI Namespace/Issuer Code	This field specifies a unique code that identifies the registered entity that created the unique transaction identifier.	Industry practices have to be followed for the creation of the namespace as these can vary for different markets. In some cases, the code is the LEI of the creating entity.
:22N: Transaction Identifier	This field specifies – in combination with the namespace – the unique transaction identifier that has been created for the trade and which must be shared with all registered entities and counterparties involved in the transaction, and used to track that particular transaction over its life.	The UTI is a combination of namespace and transaction identifier. In the US, the UTI is also called USI, more information can be found on www.cftc.gov .
:22P: PUTI Namespace/Issuer Code	This field specifies a unique code that identifies the registered entity that created a prior unique transaction identifier.	Industry practices have to be followed for the creation of the namespace as these can vary for different markets. In some cases, the code is the LEI of the creating entity.
:22N: Prior Transaction Identifier	This field specifies – in combination with the namespace – a prior unique transaction identifier that was created for the trade.	The UTI is a combination of namespace and transaction identifier. In the US, the UTI is also called USI, more information can be found on www.cftc.gov .
:77A: Additional Reporting Information ⁽¹⁾	This field specifies additional information that might be required by the regulator.	When field 22L Reporting Jurisdiction is populated with OTHR, then this field should be populated with the appropriate reporting jurisdiction. For example :77A: /OTHR/Russian Regulatory Reporting Body (using bilaterally agreed code or text).

(1) For the MT 304, field 72 should be used, as 77A is not present.

In situations where the system that generates the Swift message is not able to determine the split between the namespace and the transaction identifier, the first 20 characters of the UTI should be included in field 22M.

5.3 Examples

All the examples in this section are for an MT 300.

Example: for a single UTI where the reporting jurisdiction code is available in the standard

Sequence E Reporting Information

Subsequence E1 Reporting Parties

Reporting Jurisdiction	: 22L : CFTC
Subsequence E1a Unique Transaction Identifier	
UTI Namespace/Issuer Code	: 22M : 549300MRK1
Transaction Identifier	: 22N : 8YCMW4Q668

Example: for a trade that has two separate UTIs for different jurisdictions (as can be possible in certain scenarios) and where the reporting jurisdiction codes are available in the standard

Sequence E Reporting Information	
Subsequence E1 Reporting Parties	
Reporting Jurisdiction	: 22L : CFTC
Subsequence E1a Unique Transaction Identifier	
UTI Namespace/Issuer Code	: 22M : 123400MUG2
Transaction Identifier	: 22N : 8YBMW5T469
Subsequence E1 Reporting Parties	
Reporting Jurisdiction	: 22L : ESMA
Subsequence E1a Unique Transaction Identifier	
UTI Namespace/Issuer Code	: 22M : BGXS5YCH73QSCWDVEFBR
Transaction Identifier	: 22N : 0Y05MIXR10

Example: for a single but multi-jurisdictional UTI where the reporting jurisdiction codes are both available in the standard

Sequence E Reporting Information	
Subsequence E1 Reporting Parties	
Reporting Jurisdiction	: 22L : HKMA
Subsequence E1a Unique Transaction Identifier	
UTI Namespace/Issuer Code	: 22M : 002345XVK4
Transaction Identifier	: 22N : 3YABC4Y561
Subsequence E1 Reporting Parties	
Reporting Jurisdiction	: 22L : ESMA
Subsequence E1a Unique Transaction Identifier	
UTI Namespace/Issuer Code	: 22M : 002345XVK4
Transaction Identifier	: 22N : 33YABC4Y561

Example: for a single but multi-jurisdictional UTI where only one of the reporting jurisdiction codes is available in the standard

Sequence E Reporting Information	
Subsequence E1 Reporting Parties	
Reporting Jurisdiction	: 22L : HKMA
Subsequence E1a Unique Transaction Identifier	
UTI Namespace/Issuer Code	: 22M : 009300PPK6
Transaction Identifier	: 22N : 3YCFU4Y543

Subsequence E1 Reporting Parties	
Reporting Jurisdiction	:22L:0THR
Subsequence E1a Unique Transaction Identifier	
UTI Namespace/Issuer Code	:22M:009300PPK6
Transaction Identifier	:22N:3YCFU4Y543
End of Subsequence E1a Unique Transaction Identifier	
End of Subsequence E1 Reporting Parties	
Additional Reporting Information	:77A:/0THR/Russian Regulatory Reporting Body (using bilaterally agreed code or text)

6 MT 396 Status of Trade

6.1 Trade Status Reporting

There is a common requirement, especially in the context of market infrastructures, to be able to report on the status of an FX or derivative trade.

Whilst there is no Category 3 message that is specifically designed for reporting trade status, this section describes a market practice for using the MT 396 for this purpose.

6.2 Business Flow Example

This flow is only one example concerning trades that are processed by CLS Bank, but the MT 396 can likewise be used for status updates related to any infrastructure or other service provider.

As can be seen, the CLS third party may receive MT 396 status updates from different CLS settlement members. This document describes a standard way of structuring the MT 396, so that the third party receives a consistent format from the settlement members.

6.3 MT 396 Specifications

6.3.1 Format

For a complete description of the message, see the MT n96 Answer in the Category n - Common Group Messages - Message Reference Guide.

M/O	Tag	Field name	Content	Definition	Comments, notes, further specifications
M	20	Transaction Reference Number	16x	Unique reference number assigned to the status by the sender. This is the Sender's Reference.	
M	21	Related Reference	16x	Investment manager's or client's reference.	This is a reference that can be linked back to the original MT 3xx message to which the report relates. The transaction reference of the original message should be included in this field.
M	76	Answers	6*35x	Information reflecting the status of a trade in the infrastructure.	Two types of information are specified in this field: - Status information – represented as a code or code pair. - Additional reference information – a code representing the type of reference specified, followed by the reference. Each line of this field only specifies one piece of data. - Line 1: Must contain the code representing the status of the trade in the infrastructure in format /4!a/[4!a/], where the current status may optionally be followed by the previous status. - Line 2: Should contain the transaction reference of the original message (same as field 21 above). - Line 3: If a custodian or other service provider has a secondary reference (a system generated reference), then this is quoted in line 3. - Line 4: Should contain the infrastructure reference. (This is a reference assigned when the trade is received by for example CLS.)
O	77A	Narrative	20*35x	Contains the query in narrative form.	Optional – No usage defined
O	11A	MT and Date of the Original Message	Option R or S	(MT Number) (Date) (Session Number) (ISN) The message type number of the message to which the answer relates, and the date on which this message was sent.	Optional – No usage defined
O	79	Narrative Original Message	35*50x	Narrative description of the original message to which the answer relates.	Optional – No usage defined
		Copy of fields	Copy of fields	Copy of at least the mandatory fields of the original message.	Optional – No usage defined

M/O	Tag	Field name	Content	Definition	Comments, notes, further specifications
					Note <i>Either field 79 or a "Copy of at least the mandatory fields of the message to which the answer relates", but not both, may be present in the message.</i>

6.3.2 Field 76 Line 1 - Status Codes

The list hereafter contains standardised 4-character codes representing the most frequently used status codes.

6.3.2.1 Acceptance Status Codes

Code	Definition
PACK	Accepted for Authorisation
ACLE	Accepted for Clearing
ACCE	Accepted by Clearing Broker
REJT	Rejected by Clearing Broker
IPRC	Accepted for Settlement
ALGD	Alleged
CAND	Cancelled
DUPL	Duplicate Exception
EXCP	Exception
FRIN	Failed Rescind Instruction
INVA	Invalid
NOAU	Not Authorised
PREA	Pre-accepted
REIN	Reinstated
REJT	Rejected
REGC	Regulatory Checked
REGS	Regulatory Suspended
REPR	Repair
RESC	Rescinded
SUSP	Suspended
VALI	Validated

6.3.2.2 Matching Status Codes

Code	Definition
ALGD	Alleged

Code	Definition
ERRR	Error
MACH	Matched
NMAT	Unmatched
UNCO	Unconfirmed
CONF	Confirmed

6.3.2.3 Clearing Status Codes

Code	Definition
CAND	Cancelled
CLEA	Cleared
NOVA	Novated
PARK	Parked
PENC	Pending Cancellation
PENP	Parked Cancellation
RECE	Received
REJT	Rejected
REJC	Rejected Cancellation

6.3.2.4 Settlement Status Codes

Code	Definition
SMAU	Settlement Authorised
SMAT	Settlement Mature
SMNA	Settlement Not Authorised
SETT	Settled
PART	Partially Settled
REJS	Settlement Rejected
SPLT	Split

6.4 Field 76 Lines 2, 3, and 4 - References

Should additional references be specified, these are specified on lines 2, 3, and 4 of field 76. One of the following codes should be used to follow the reference itself:

/SREF/	Client Reference	The reference used by the investment manager or other client to identify the trade.
/PREF/	Service Provider's Reference	This is the custodian's or other service provider's optional secondary, system generated reference.
/CREF/	Central Infrastructure Reference	Reference assigned by a central infrastructure, such as the CLS system or CCP when the trade message is received.

6.5 Examples

6.5.1 Status is Settled

: 20 : A0001	Reference assigned by the sender to identify the message.
: 21 : TRADE001	Investment manager's reference for the trade.
: 76 : /SETT/ /SREF/TRADE001 /PREF/CUST0001 /CREF/AF79234	Status is settled. Investment manager's reference for the trade (same as field 21). Custodian's reference for the trade. Reference in CLS.

NEXT VERSION

7 ISO 20022 Adoption for Payments

Starting March 2023, cross-border payment and reporting messages (CBPR+) have begun adopting ISO 20022.

Key equivalent messages to note are:

- MT 103 > pacs.008 (pain.001 must be used where a bank is initiating a payment to a corporate)
- MT 202 > pacs.009
- MT 210 > camt.057

Once MTs 300 are confirmed and matched settlement of these takes place as payments.

The adoption of ISO 20022 by the payments industry brings with it the ability to include more data and better quality structured data.

When mapping data from an MT 300 onto subsequent settlement payments, field 22C Common Reference should be mapped to the End to End Identification element of the pain.001, pacs.008, and pacs.009. It should also be mapped to the Identification element on the camt.057.

An appropriate code should also be populated from the code sets published on the ISO 20022 website in the Category Purpose and Purpose elements on the pain.001, pacs.008, and pacs.009. For example, a user could populate Category Purpose code CORT (Trade Settlement Payment) and Purpose Code FREX (Foreign Exchange).

The CBPR+ User Handbook and CBPR+ Sample Messages available in Swift's MyStandards portal can be consulted for business flows and example messages.
